

Research collaboration in six parts

Moxian Qian | github.com/qxxmax/skillforpaper

• Six parts form one continuous research workflow

1

Part 1 | Explore the landscape

released

Identify the target from a verbal clue, expand over multiple rounds, and return to original sources to establish evidence, lineage, and boundaries.

Output: source matrix | reading record | lineage | gap ledger | report

2

Part 2 | Track the field and its methods

next

Continuously track new papers, methods, code, datasets, and author networks to update the knowledge map.

Output: update brief | change log | reading queue

3

Part 3 | Complete a research project

roadmap

Turn the question into hypotheses, algorithms, experiments, validation, and iterations with explicit inputs, outputs, and checks.

Output: research plan | experiment ledger | validated artifacts

4

Part 4 | Write the proposal

roadmap

Start from the literature gap and organize objectives, methods, work packages, risks, budget, and deliverables.

Output: proposal | evidence map | reviewer questions

5

Part 5 | Build and package the project

roadmap

Complete the code, data, paper, repository, and reproducibility checks, then prepare submission and public release.

Output: paper | repository | reproducibility package | submission

6

Part 6 | Prepare slides for each venue

roadmap

Reshape the story for the audience, time, and venue; prepare the main talk, backup, script, and visual checks.

Output: slides | poster | rehearsal view | backup

Current progress: Part 1 / 6 released

verbal clue -> candidate pool -> source-link audit -> C0-C4 -> lineage -> gap ledger -> report

Install, public SPS run, and full outputs: github.com/qxxmax/skillforpaper

Part 1 maps the research object and literature space; Parts 2-6 are the development roadmap.

The route can scale with the project, but identification, execution, validation, and delivery remain explicit.
